

SUB ZERO CASE STUDY

A single source of consolidated worldwide information

Krupal Patel – Senior Compliance Engineer

At Sub-Zero, I'm responsible for the acquisition and management of material declarations. I also support design engineering compliance initiatives including monitoring and tracking future regulations, laws and directives concerning material related compliance.

Our Challenges

The rate of change of global legislation affecting our products is constantly increasing. At Sub-Zero we struggled because we did not have one overall source to monitor these regulatory activities worldwide. The information we received was from numerous locations and was fragmented.

Advantages of Using C2P

Compliance & Risks offered us exactly what we needed - a single source of consolidated worldwide regulatory information and an easy way to monitor the changes that affected our products. The breadth and depth of content matched exactly what we needed including:

- California Prop 65
- Conflict Minerals
- EU REACH
- Climate Change
- Ecodesign
- E-Waste
- Energy Efficiency
- Hazardous materials and substances
- Packaging
- Product Safety / EMC

The daily alerts, access to expert opinions, market entry reports on an as needed basis and the ability to share information with our international partners made C2P, the compliance management platform, the perfect choice for us.

In the past, we were always playing catch up. However, now we are able to monitor and stay on top of worldwide regulatory activities that are specific to our products. This enables us to be more proactive in addressing issues related to forthcoming regulations.

About Sub-Zero

Established 70 years ago, Sub-Zero Group, Inc. is a leading manufacturer of luxury appliances. The third-generation, family-owned company is based in Madison, Wisconsin where it was originally founded, and has specialized in the beauty and performance of refrigeration over those seven decades. That dedication to creating innovative, technologically advanced products with design flexibility is why both Sub-Zero and Wolf are category frontrunners, engineering the most desired products in high-end kitchens.
